Rockustics Driver Identification

At Rockustics, we are constantly improving our products. Because of this, it is possible that older speakers may not match current production stock. Use this guide to tell us how to send your replacement drivers.

Speakers with a Crossover Board
Models that have a crossover board use standard drivers with spade connectors. If you see a crossover inside your speaker (pictured below), please inform customer service that you need a standard driver for your speaker. Also provide customer service with the model of the rock.

Speakers without a Crossover Board
Some speaker models have the electrical filter soldered directly to the driver, instead of a crossover board. If you open your speaker and do not see a crossover (example pictured below), please inform customer service that you need a driver with the filter soldered on, with a soldered wire whip. Also provide customer service the model of the rock.
